

Introduction to Blend Modes

Blend Modes – Process Explanation

1. A base landscape image was used as the primary layer. Additional overlay layers such as light effects and color enhancements were added on top.
2. Screen Blend Mode was applied to a light/glow layer near the sword area. This made the bright areas more visible while removing dark parts, creating a glowing effect that enhances the sword and adds a cinematic highlight.
3. Overlay Blend Mode was used to enhance overall contrast and color richness. This increased the depth of the image by making highlights brighter and shadows darker, giving the scene a more dramatic and vibrant look.
4. Multiply Blend Mode was applied subtly to darker areas or textures. This helped deepen shadows and add intensity, especially around the character, making the subject stand out more from the background.
5. Opacity of each blend mode layer was adjusted to maintain a natural appearance and avoid over-editing.
6. The final result shows improved lighting, stronger contrast, and enhanced visual focus using blend modes.
