

## Smart Objects – Explanation

Smart Objects are used in Photoshop to allow non-destructive editing. This means changes made to the image do not permanently affect the original content.

In this task, the image layer was converted into a Smart Object. This allowed transformations like resizing without losing image quality. Even after scaling the image multiple times, the quality remained intact.

A Smart Filter (Gaussian Blur) was applied to the Smart Object. Unlike normal filters, Smart Filters can be edited or removed at any time, making the workflow flexible.

Overall, Smart Objects help maintain image quality and allow easy modifications, making editing more efficient and non-destructive.
