

Using Built-in & Custom Actions

In this task, I created a custom action in Adobe Photoshop called “Custom Exposure” to improve the overall look of an image.

While recording the action, I adjusted the brightness to -21 and increased the contrast to +14 to balance the lighting and make the image look sharper. Then, I increased the vibrance by +9 to enhance the colors without making them too strong. I also adjusted the color balance by increasing the blue tones slightly (+7) to give the image a cooler and more cinematic feel.

After recording all these steps, I stopped the action and saved it. I tested the action on another image, and it applied all the adjustments automatically in one click.
