SUMMARY NOTES

Complete Cosmetic Retouching
Lessons 15 & 16

THIS LESSON GIVES YOU THE SKILLS TO REMOVE BLEMISHES, REDUCE OR REMOVE LINES AND WRINKLES, ELIMINATE SHINY SKIN, IMPROVE LIGHTING AND ENHANCE COLOUR AND TONE. HERE YOU WILL LEARN THE SKILLS TO TAKE YOUR PORTRAITS TO A PROFESSIONAL STANDARD.

4.01 Healing Tools

4.02 Tool Techniques

4.03 Liquify Filter

4.04 Negative Clarity

4.05 Frequency Separation

4.06 Blemish v Characteristics

HEALING TOOLS

“To get the best use of the healing tools and to speed up your workflow, it is recommended to use the Photography Workspace instead of Essentials. ”

Healing tools are used for a number of reasons but have the power to help with cosmetic retouching, photo-restoration and removing unwanted objects. All of the healing tool share the same shortcut of J, with the exception of the clone stamp tool which has a shortcut of S.

The Healing Tools consist of:

- Red-Eye Tool
- Spot Healing Tool
- Healing Tool
- Clone Stamp Tool
- Patch Tool

Note: To get the best use of the healing tools and to speed up your workflow, it is recommended to use the Photography Workspace instead of Essentials. This will allow easy access on the toolbar as each healing tool will have its own spot. It will also change certain Panels to suit the idea of re-touching. The best practice is to customise a version to suit your own needs.

RedEyeTool removes red eye in flash photos of people and also animals (known as 'pet eye'). Simply duplicate your background layer, select the Red Eye Tool and click on the affected eye. The tool will do the rest!

SpotHealingTool is very useful for removing small objects like acne spots or pieces of dust from your image. It automatically samples from around the retouched area, and replaces one set of pixels with another.

1. Select the spot healing tool from the toolbar. Choose a brush size from the options bar. It is advisable to choose a brush slightly larger than the object you wish to remove.
2. Choose a Type option in the Options bar. We recommend that you select Content-aware. Content-Aware compares nearby image content to seamlessly fill a selection, realistically maintaining key details such as shadows and object edges.
3. Make a new blank layer and select 'Sample All Layers' in the options bar.
4. Click on the area you want to fix, making sure you are on the new blank layer that you just created.

HealingTool works similarly to the SpotHealingTool but is rather less sophisticated because it's a lot less automatic.

1. Select the Healing Brush Tool from the toolbar. Choose a brush size from the options bar. It is advisable to choose a brush slightly larger than the object you wish to remove.
2. In the Options bar, set Source as 'Sampled'.
3. Press and hold alt (option key on Mac OSX). This will sample an area. The sampled area can now be used simply by clicking on the objects you want to remove.
4. You may need to make more than one sample for realistic results.

TheCloneStampTool is one of the most useful retouching tools in all of Photoshop and functions very similarly to the Healing Tool. It works by copying or cloning pixels from a selected target area and placing them over unwanted objects.

1. Select the Clone Stamp Tool from the toolbar. Choose a brush size from the options bar. It is advisable to choose a brush slightly larger than the object you wish to remove.
2. Select 'Align' from the options bar. This will sample pixels continuously without losing the current sampling point, even if you release the mouse button. By doing so it will avoid repeating samples.
3. Set the sampling point by holding alt (windows) / option (Mac OSX) and clicking on the area you wish to sample.
4. Drag over the area of the image you want to correct.
5. You can change the brush size quickly and easily by using the square bracket keys.

The Patch Tool lets you repair a selected area with pixels from another area. It matches the texture, lighting, and shading of the sampled pixels to the source pixels.

1. Select the Patch Tool from the toolbar.
2. Duplicate your background layer.
3. Draw a tight selection around object you wish to remove using the Patch tool.
4. Make sure to select 'Source' in the options bar.
5. Drag the selected area away to an area you would like Photoshop to sample from.

The object will be removed. You may need to repeat process more than once for best results.

TOOL TECHNIQUES

Content Aware Fill is another technique used to remove unwanted objects from an image or fill blank pixels.

1. Simply duplicate your layer.
2. Make a loose selection around the object you wish to remove using the Lasso Tool.
3. Edit > Fill.
4. In the dialogue box, under the Content dropdown menu select Content Aware.
5. In the dialogue box, make sure 'Colour Adaptation' is ticked on.
6. Click okay and the area will be filled.

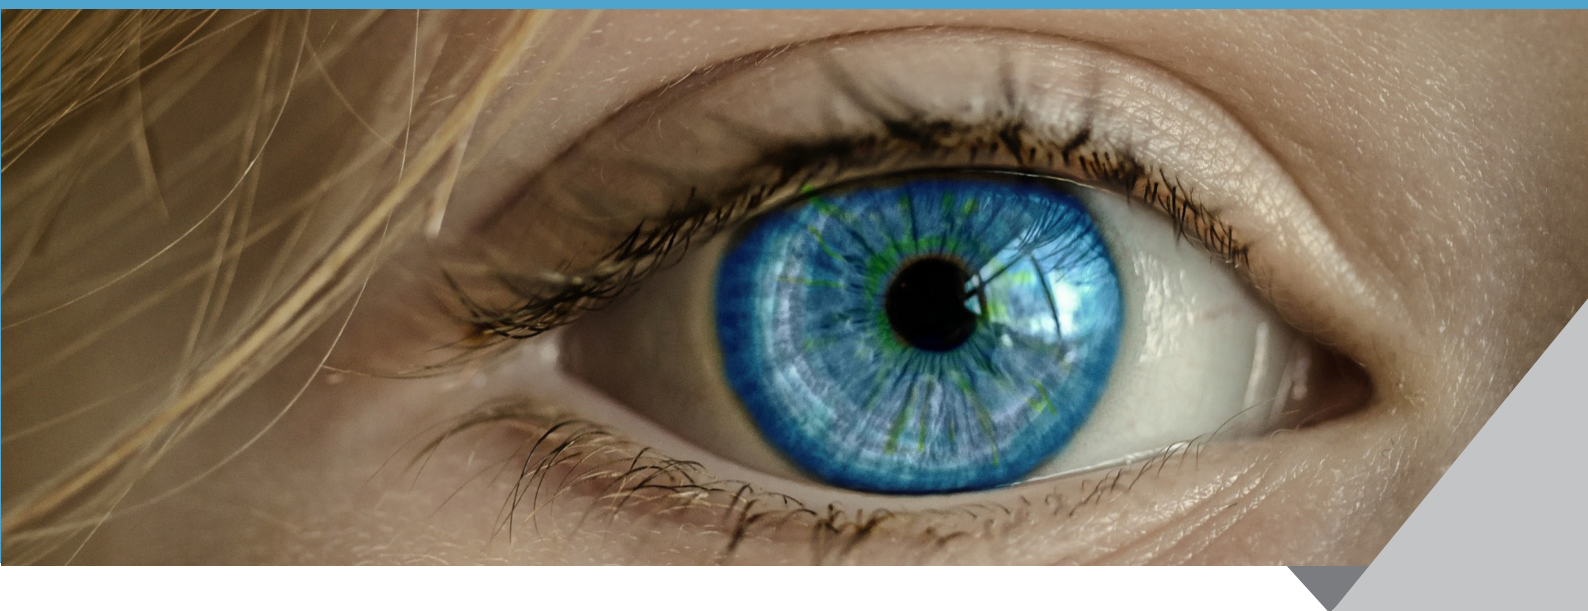

Fade can be used with a range of tools but is a great option to use when using the patch tool.

Shortcut: Shift + CTRL + F / Shift + CMD + F

1. Select the area with patch tool
2. Use patch tool as normal
3. Fade detail back in.

Non-Destructive Dodge & Burn is similar to the method provided in Advanced Layers & Masks.

1. Create new layer
 2. Apply Overlay Blend mode from drop down.
 3. Fill with 50% Grey
 4. Use different Shades of Grey with brush for Dodge and Burn effect.
- Optional: Low opacity brush tool for build-up.

Highlight or Change Eye colour

1. Select area with quick mask or selection tool.
2. Add colour adjustment Recommend adjustments: Hue/Saturation, Vibrance, Colour Balance.
3. Invert Adjustment Mask.
4. Soft brush tool – set to white
5. Clean up selection.

Whiten Eyes

1. Create a New layer,
2. Make sure the colour picker is on White and choose your brush tool brush
3. Paint the area that needs to be white,
4. Lower opacity and repeat
5. Clean up selection with healing tools before or after.

Other Eye Options: Hue/Saturation or Brush Tool

1. Select area with quick mask or selection tool.
 2. Add Hue/Saturation adjustment or new layer for Brush tool
 3. Apply Blend mode or lower opacity.
- Add Fake Eyelashes using Brush tool (demonstrated in brush tool essentials)

Contouring Skin

1. Add contouring using new layers Using the brush tool,
2. blend mode: Overlay
3. Lower the opacity to add highlights and Shadows to areas.

LIQUIFY FILTER

The Liquify filter lets you push, pull, rotate, reflect, pucker, and bloat any area of an image. The distortions you create can be subtle or drastic, which makes the Liquify command a powerful tool for retouching images as well as creating artistic effects. The Liquify filter can be applied to 8-bits per-channel or 16-bits per-channel images.

Note: In the Creative Cloud version of Photoshop, the Liquify filter is significantly faster than previous versions. The Liquify filter now supports Smart Objects, including Smart Object video layers, and is applied as a smart filter. Another enhancement to the Liquify filter is an added behavior for the Reconstruct tool. If you hold down the alt (Windows) or Option (Mac OS) key while dragging the tool across a warp, the Reconstruct tool smooths a warp rather than scaling back or removing it.

Several tools in the Liquify dialog box distort the brush area when you hold down the mouse button or drag. The distortion is concentrated at the centre of the brush area, and the effect intensifies as you hold down the mouse button or repeatedly drag over an area.

ForwardWarpTool pushes pixels forward as you drag.

ReconstructTool reverses the distortion you've already added, as you hold down the mouse button and drag.

TwirlClockwiseTool rotates pixels clockwise as you hold down the mouse button or drag.

PuckerTool moves pixels toward the centre of the brush area as you hold down the mouse button or drag.

BloatTool moves pixels away from the centre of the brush area as you hold down the mouse button or drag.

PushLeftTool moves pixels to the left when you drag the tool straight up and pixels move to the right if you drag down.

FreezeMaskTool, drag over the area you want to protect. Freeze areas that you don't want to modify or thaw frozen areas to make them editable again. Shift-click to freeze in a straight line between the current point and the previously clicked point

Optional for all Tools: You can change the brush size, density, pressure, speed and pen tablet pressure.

Note: Shift-click with the tools to use them in an alternative way. The push Left will Push Right etc.

Face-Aware Liquify

Introduced in Photoshop CC 2015.5 release, and is not available in versions before this or certain versions of Elements. The Liquify filter features advanced face-aware functionality that automatically identifies eyes, noses, mouths, and other facial features, making it easy for you to adjust them. Face-Aware Liquify is great for retouching portrait photos, creating caricatures, and doing much more.

With Sliders:

In Photoshop, open an image with one or more faces.

Select Filter > Liquify. Photoshop opens the Liquify filter dialog.

In the Tools panel, select  (Face tool; keyboard shortcut: A).

You can select a different face by clicking it on the canvas or selecting it from the pop-up menu.

Adjust the sliders in the Face-Aware Liquify area to make appropriate changes to the facial features. Eg: Eyes, Nose, Face.

When finished click Ok.

Without Sliders:

In Photoshop, open an image with one or more faces. Select Filter > Liquify. Photoshop opens the Liquify filter dialog.

In the Tools panel, select  (Face tool; keyboard shortcut: A). The faces in the photo are automatically identified.

When you hover the pointer over the faces, Photoshop displays intuitive onscreen controls around them. Adjust the controls to make adjustments to the faces. For example, you can increase the eye size or decrease the face width.

When you're satisfied with the changes, click OK.

NEGATIVE CLARITY

Negative clarity blurs the image to make the skin seem clear. This alters pixels and is a destructive method.

1. Open Image in Adobe Camera Raw (ACR) or use ACR filter in Photoshop.
2. Select Adjustment Brush Shortcut K
3. Turn off Overlay option.
4. Mask the area, apply auto mask for better selection.
5. Lower Clarity
6. Raise Sharpness.
7. When satisfied select OK.

Note: You can apply base healing before or after these steps so find what works for you.

FREQUENCY SEPARATION

Frequency separation involves splitting our image into two layers, which allows us to work on the colour and the texture independently of each other. You must duplicate the image twice and Name the layers.

Top layer: High Frequency – Textures. This layer will contain the detail

Lower Layer: Low Frequency – Colours. This layer will contain the colour information.

Low Frequency – Colours

1. Go to Filter > Blur > Gaussian Blur
2. Blur the image until sharp detail is gone. This is usually a radius of 3-5 pixels but will differ depending on images.

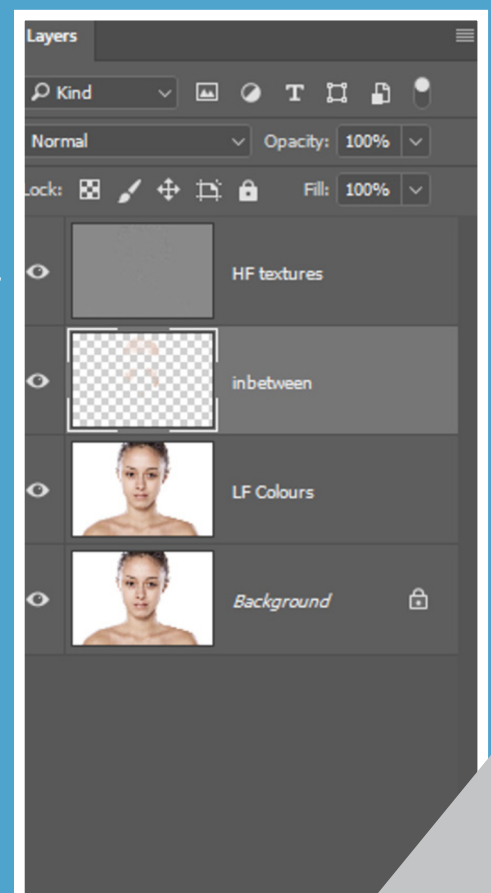

High Frequency – Textures

1. Go to Image > Apply image
2. In the drop-down menu select LF – Colours layer.
3. Fill in these Properties
 - Channel: RGB
 - Blend Mode: Subtract
 - Opacity: 100%
 - Scale: 2
 - Offset: 128
4. Set blend mode of the HF-Textures layer to Linear Light

New Layer

1. Create a new layer
2. Place in between LF and HF layers
3. In options bar select current and below • Select Clone Stamp Tool
4. Soft brush.
5. Opacity of Clone Stamp tool to 10%-15%
6. Sample good area with Alt/Option key.
7. Blend in detail.

Note: You can apply base healing before or after these steps so find what works for you.

Complete Cosmetic Retouching
