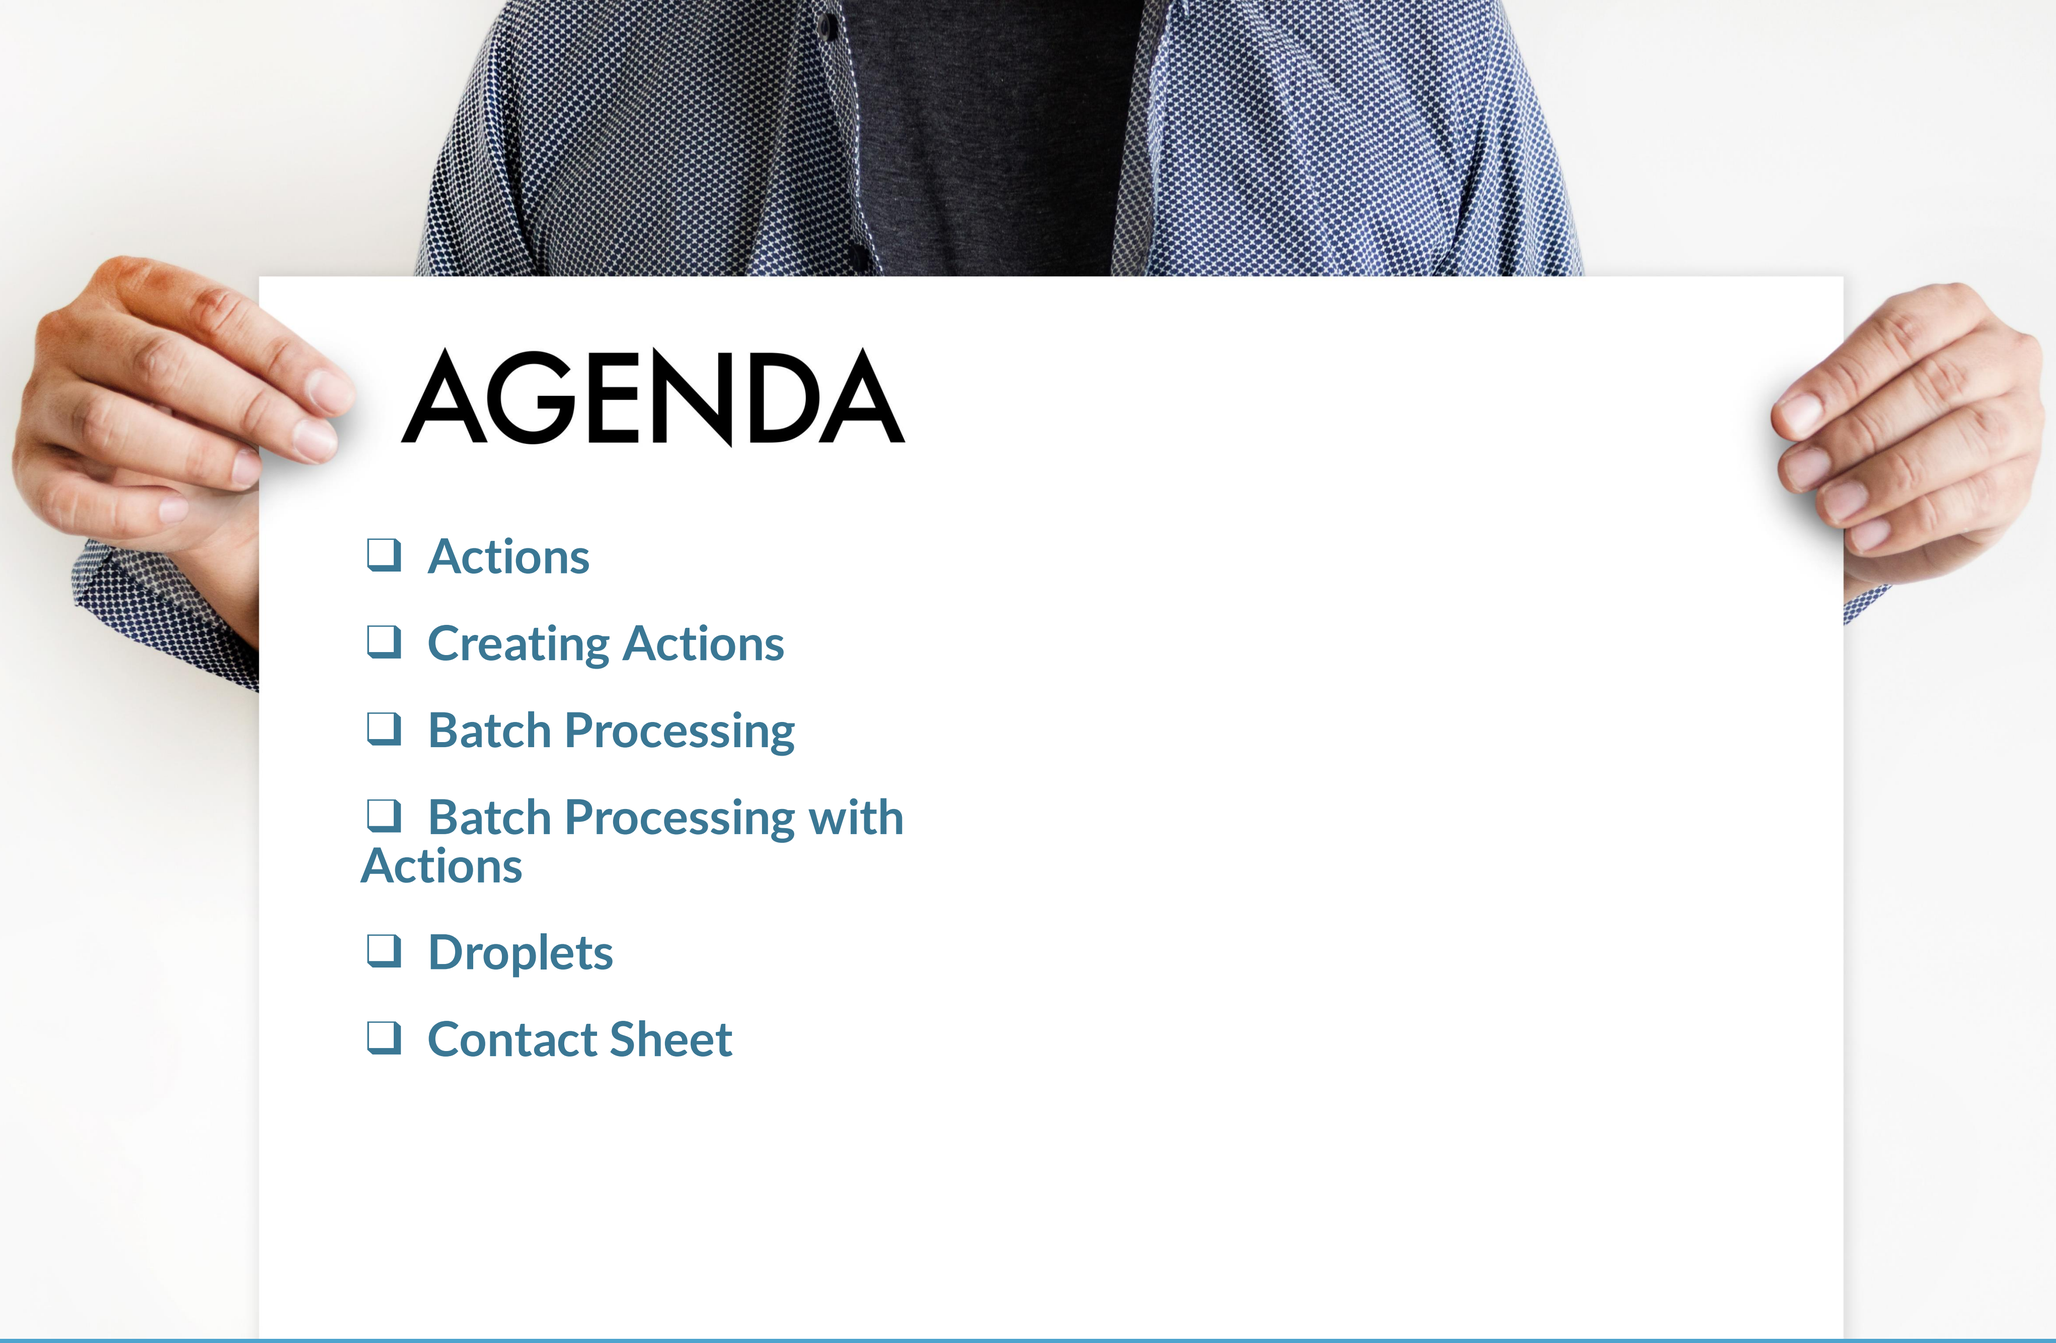
Lesson 25
Creative Photoshop

Actions And Batch Processing



AGENDA

- ❑ Actions
- ❑ Creating Actions
- ❑ Batch Processing
- ❑ Batch Processing with Actions
- ❑ Droplets
- ❑ Contact Sheet

Actions

What is an Action?

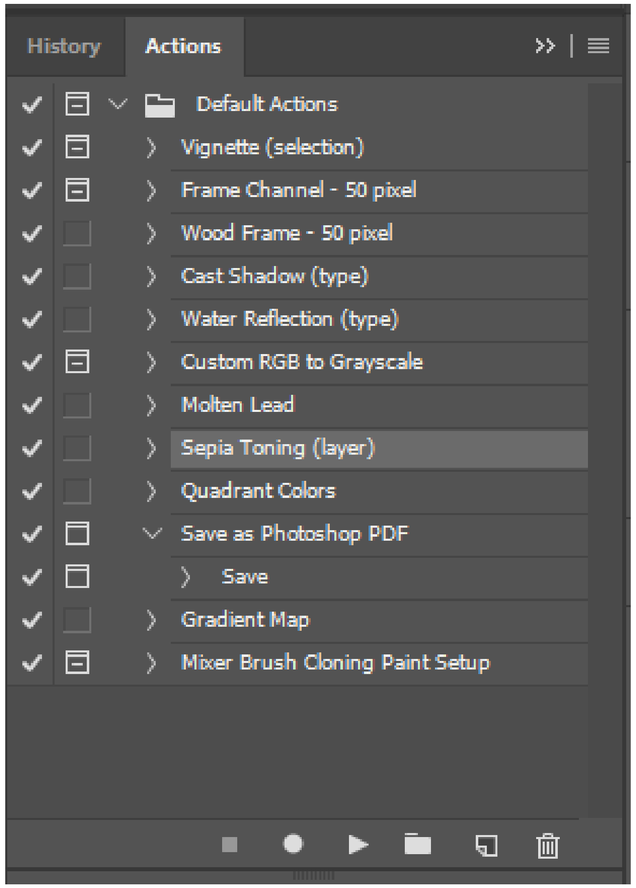
Actions allow us to create or use pre-sets of stored recorded editing steps. Using a simply play and stop function the actions can be applied to images at a faster rate. This stops the need to repeat simple steps or complex techniques.

Where are Actions located?

Menu > Window > Actions

Actions files are saved as separated files much like brushes. The file extension is ATN.

Actions can be saved and imported to other machines.



Creating Actions

Action Guidelines

You can record most (but not all) commands in an action

By default, actions are completed using the values specified when they were originally recorded

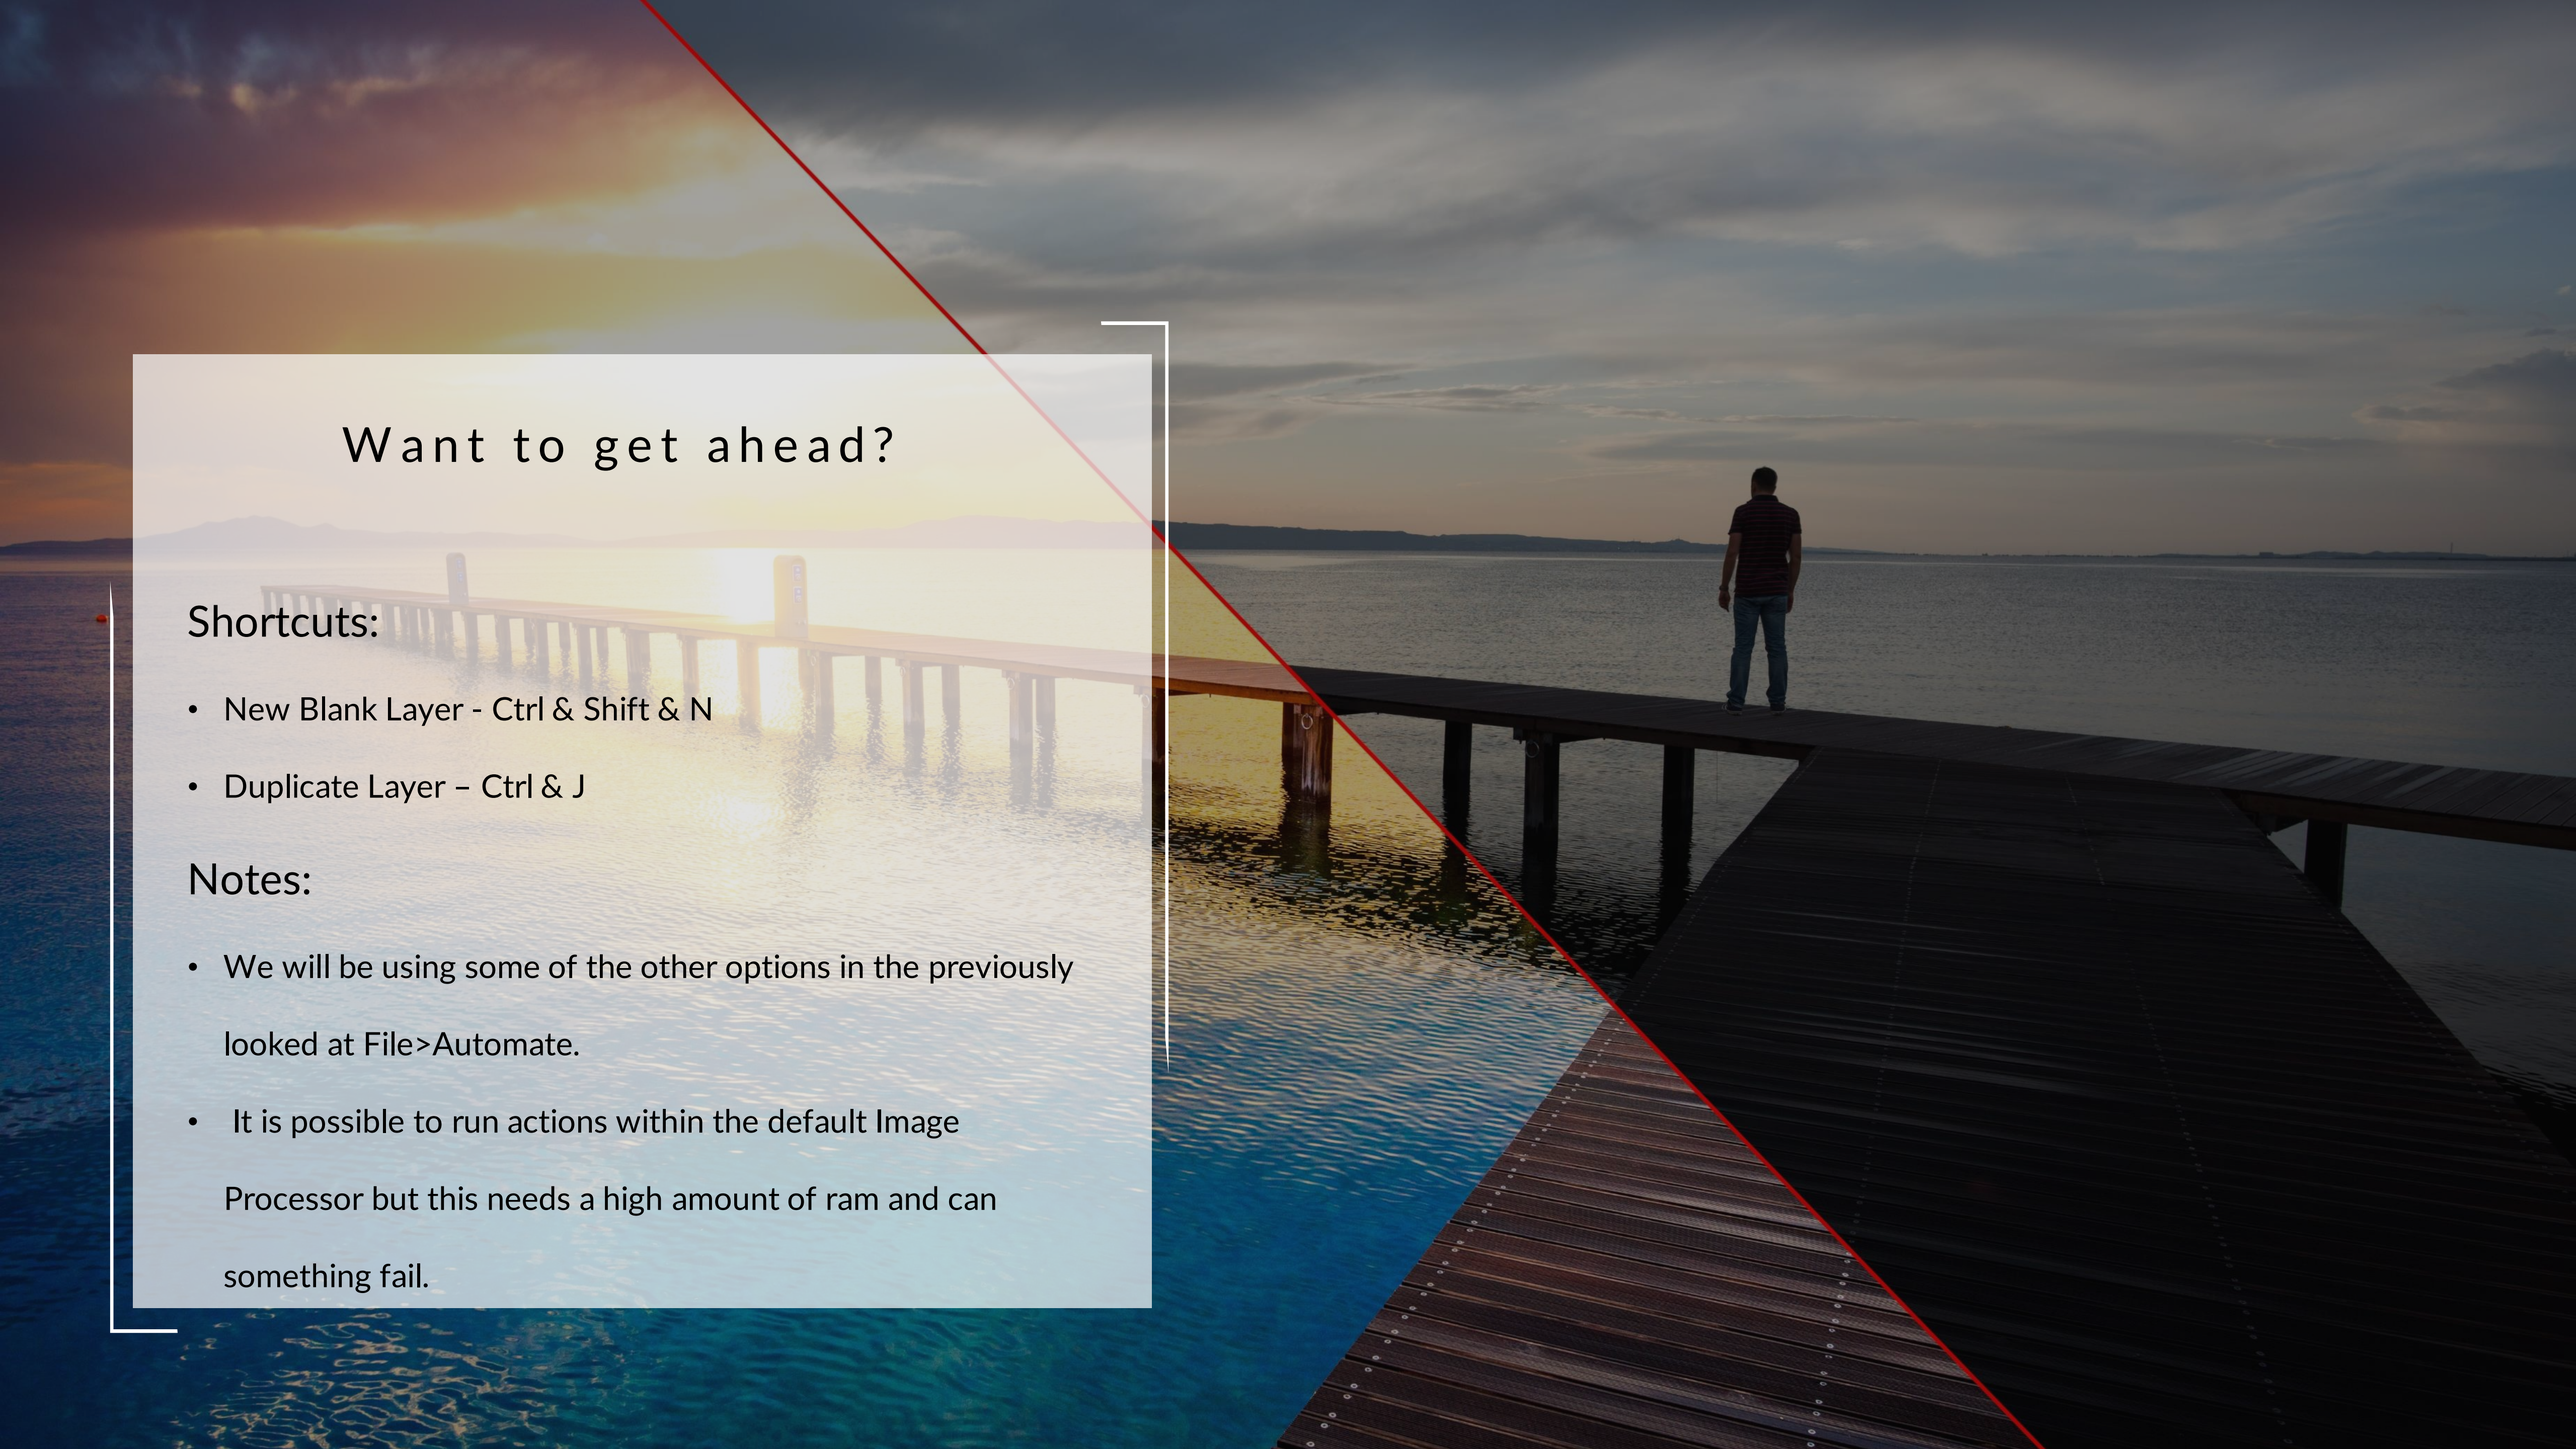
Avoid pressing on layers and naming layers.

Results depend on file and program setting variables, such as the active layer, image size/Dpi and the foreground colour.

You can record the Play command listed on the Actions panel menu to cause one action to play another

You can include stops in an action that let you perform a task that cannot be recorded.

A modal control pauses an action so that you can specify values



Want to get ahead?

Shortcuts:

- New Blank Layer - Ctrl & Shift & N
- Duplicate Layer – Ctrl & J

Notes:

- We will be using some of the other options in the previously looked at File>Automate.
- It is possible to run actions within the default Image Processor but this needs a high amount of ram and can something fail.
