SUMMARY NOTES

The Power Of Smart Objects
Lessons 23 & 24

SMART OBJECTS ARE THE ULTIMATE WAY TO PRESERVE AN IMAGE'S SOURCE CONTENT WITH ALL OF ITS ORIGINAL CHARACTERISTICS, ENABLING YOU TO PERFORM COMPLETE NON-DESTRUCTIVE EDITING WHERE NO PIXELS GET DAMAGED IN THE PROCESS.

4.01 Smart Objects

4.02 Smart Filters & Adjustments

4.03 Linked Smart Objects

4.04 Tiny Planet

The Power Of Smart Objects

SMART OBJECTS

“Smart Objects preserve an image’s source content with all its original characteristics, enabling you to perform non-destructive editing to the layer.”

Smart Objects are layers, that contain image data from raster or vector images such as Photoshop or Illustrator files. Smart Objects preserve an image’s source content, with all its original characteristics, enabling you to perform non-destructive editing to the layer.

Smart Objects preserve an image’s source content with all its original characteristics, enabling you to perform non-destructive editing to the layer. When you convert an image to a Smart Object, what you are effectively doing is saving the raw data about that image, within the Photoshop PSD file itself.

Note: A Raster image or Bitmap are also known as raster images, and these each consist of a fixed number of pixels, and are therefore resolution-dependent. Raster images can lose detail and appear jagged (pixelated) if they are scaled up, Unlike a smart object.

Note: Vector Graphics are made up of lines and curves defined by mathematical objects (vectors), and maintain crisp edges that lose no detail when resized because they are resolution-independent. This resolution-independence makes vector graphics a good choice for visual elements, such as logos, that will be used at various sizes, Unlike a smart object.

What can we do with Smart Objects?

With Smart Objects, you can:

1. Perform nondestructive transforms.
2. You can scale, rotate, skew, distort, perspective transform, or warp a layer without losing original image data or quality because the transforms don't affect the original data.
3. Work with vector data, such as vector artwork from Illustrator, that otherwise would be rasterized in Photoshop.
4. Non-destructive filtering.
5. Edit one Smart Object and automatically update all its linked instances.
6. Apply a layer mask that's either linked or unlinked to the Smart Object layer.
7. Try various designs with low-resolution placeholder images that you later replace with final versions.

What can we not do with Smart Objects?

With Smart Objects, you cannot:

1. Perform operations that alter pixel data (Painting, cloning, dodging and burning etc)
2. Use the Content Aware Commands.

How to create Smart Object in Photoshop**Converting Options:**

- Menu: Layer > Smart Objects > Convert to Smart Object
- Layer: Right Click > Convert to Smart Object

Placement Options:

- Menu: File > Place Embedded
- Folder: Drag & Drop

Rasterising Options:

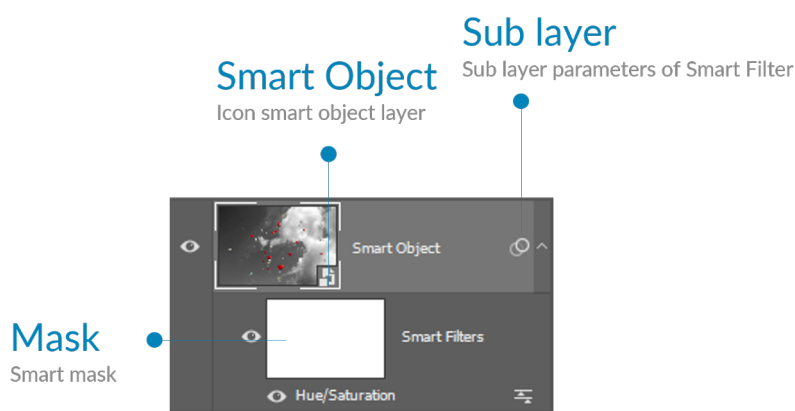

- Menu: Layer > Rasterize
- Layer: Right Click > Rasterize

SMART FILTERS& ADJUSTMENTS

Using Smart Object allows us to be non destructive. This option works when using destructive adjustments instead of Adjustment layers. It will also allow you to add filters to your images as non-destructive edits as it is attached to the smart objects.

Any filter applied to a Smart Object is a Smart Filter. Smart Filters appear in the Layers panel below the Smart Object layer to which they are applied. Because you can adjust, remove, or hide Smart Filters, they are non-destructive. You can apply any Photoshop filter (that has been enabled to work with Smart Filters)—except for Lens Blur, Flame Picture Frame, Trees, and Vanishing Point—as a Smart Filter. To work with Smart Filters, select a Smart Object layer, choose a filter, and then set filter options. After you apply a Smart Filter, you can adjust, reorder, or delete it. In addition, you can apply Adjustments from the image menu as non-destructive Smart Filters (Smart Adjustments)

All of these options come stackable allowing for greater creativity and editing capabilities. Each smart adjustment/filter allows you to apply different levels of opacity and to assign different blend modes while also having these options as a whole on the layer itself.

LINKED SMART OBJECTS

In Photoshop CC, you can create Linked Smart Objects. The contents of Linked Smart Objects are updated when the source image file changes. Smart objects can be contained in a .PSB file. This file store easy to update content. When updated it automatically updates the linked Smart object in the original PSD document.

What is a linked layer used for?

Linked Smart Objects are particularly useful for teams or in cases where assets must be reused across designs.

The contents of Linked Smart Objects are updated when the source image file changes. Linked Smart Objects are particularly useful for teams or in cases where assets must be reused across designs.

Follow these steps to create a Linked Smart Object:

- Convert or place your smart object.
 - Double click the icon to open .PSB file.
- or**
- Choose File > Place Linked.
 - Select an appropriate file and click Place.

Note: A Linked Smart Object is created and is displayed in the Layers panel with a link icon

Edit Linked Smart Objects

Select the Smart Object from the Layers panel, and do one of the following:

- Choose Layer > Smart Objects > Edit Contents.
- Double-click the Smart Objects thumbnail in the Layers panel.
- In the Properties panel, click Edit Contents

Note: Make sure to save the .PBS file to update the linked Smart Object.
