SUMMARY NOTES

Actions & Batch Processing
Lessons 25 & 26

PHOTOSHOP ACTIONS ALLOW US TO RECORD THE VARIOUS STEPS WE USE WHEN MAKING A CHANGE TO AN INDIVIDUAL IMAGE, AND THEN APPLY THESE CHANGES TO MULTIPLE IMAGES ALL AT ONCE. THIS SAVES US HOURS UPON HOURS OF IMAGE EDITING TIME AND HELPS US DEVELOP AN EFFICIENT WORKFLOW.

1.01**Actions**

1.02**Batch Processing**

1.03**Droplets**

1.04**Image Processor**

Actions & Batch Processing

ACTIONS

“For example, you can create an action that changes the size of an image, applies an effect to the image, and then saves the file in the desired format.”

An action is a series of tasks that you play back on a single file or a batch of files. It contains menu commands, panel options, tool actions, and so on. For example, you can create an action that changes the size of an image, applies an effect to the image, and then saves the file in the desired format.

Guidelines for recording actions

- You can record most—but not all—commands in an action.
- You can record operations that you perform with the Marquee, Move, Polygon, Lasso, Magic Wand, Crop, Slice, Magic Eraser, Gradient, Paint Bucket, Type, Shape, Notes, Eyedropper, and Color Sampler tools, as well as those that you perform in the History, Swatches, Color, Paths, Channels, Layers, Styles, and Actions panels.
- Results depend on file and program setting variables, such as the active layer and the foreground color. For example, a 3-pixel Gaussian blur won't create the same effect on a 72-ppi file as on a 144-ppi file.
- Color Balance will not work on a grayscale file.
- When you record actions that include specifying settings in dialog boxes and panels, the action will reflect the settings in effect at the time of the recording. If you change a setting in a dialog box or panel while recording an action, the changed value is recorded.
- You can record the Play command listed on the Actions panel menu to cause one action to play another.

Actions & Batch Processing

Action Panel

With Actions, you can record, edit, customize, and batch-process actions, and you can manage groups of actions by working with action sets.

History: Used to see the steps you have taken and to undo or redo steps.

Actions: The default palette for the Actions process.

Bin/Delete Icon: Allows you to remove Actions, sets of actions or individual steps within Actions.

New Action Icon: Used to create a new action. Will create a pop up that allows you to define the action by Name, Set, Apply a Function Key (Shortcut), Colour for the Button mode.

New Set Icon: Used to Create A new set or folder to group the created actions.

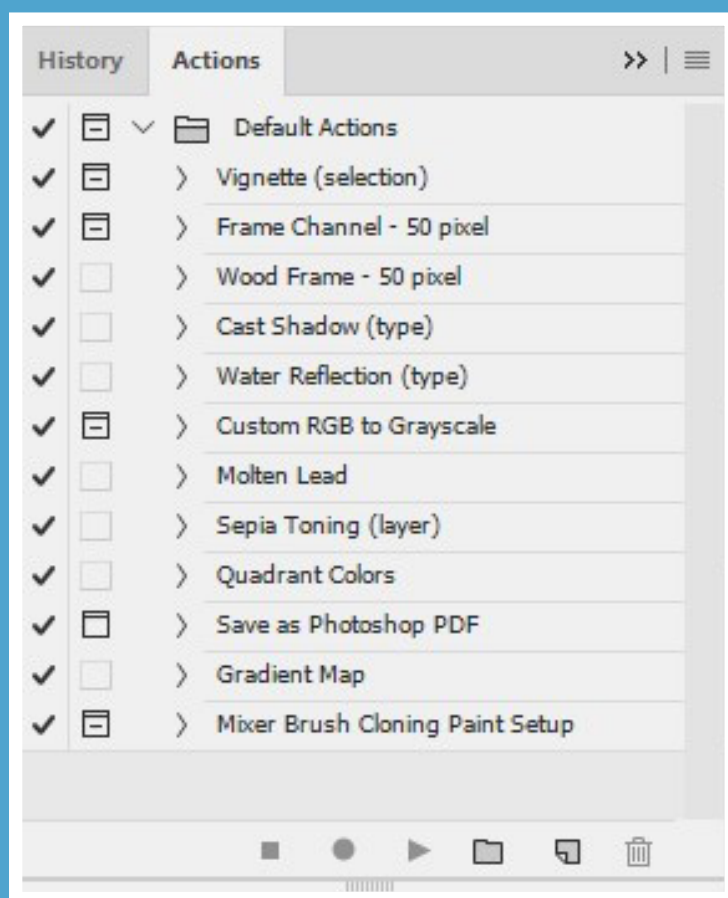

Play Icon: Will Apply the chose selection to the image you have selected.

Record Icon: Will begin the process needed to create an action step by step.

Pause/Stop Icon: will allow you to stop the recording process of the Action.

Modal: Toggle On and Off controls for certain action processes.

Action Examples

High Pass Action:

1. New action >
2. New layer (blank) >
3. Stamp Ctrl + Shift + Alt + E >
4. Duplicate layer Ctrl + J >
5. Filter - High Pass >
6. Merge >
7. save > end.

3d Anaglyph Action:

1. New action >
2. New layer (blank) >
3. Stamp Ctrl + Shift + Alt + E >
4. Levels adjustment - Destructive >
5. Duplicate layer Ctrl + J >
6. Layer Styles - Blending options - Turn off R option.
7. save > end.
8. Move 5 steps left 5 up with move tool and arrow keys.

BATCH PROCESSING

The Batch command runs an action on a folder of files or open images. You can also import and process multiple images with a single action.

When batch-processing files, you can leave all the files open, close and save the changes to the original files, or save modified versions of the files to a new location (leaving the originals unchanged).

The Batch command runs an action on a folder of files. If you have a digital camera or a scanner with a document feeder, you can also import and process multiple images with a single action. Your scanner or digital camera may need an acquire plug-in module that supports actions. You can also import PDF images from Acrobat Capture or other software.

When batch-processing files, you can leave all the files open, close and save the changes to the original files, or save modified versions of the files to a new location (leaving the originals unchanged). If you are saving the processed files to a new location, you may want to create a new folder for the processed files before starting the batch.

Note: To batch-process using multiple actions, create a new action that plays all the other actions, and then batch-process using the new action.

1. Choose File > Automate > Batch
2. Choose the action you want to use apply to the files from the pop-up menus. Options:
 - **Folder:** Processes files in a folder you specify. Click Choose to locate and select the folder.
 - **Import:** Processes images from a digital camera, scanner, or a PDF document
 - **Opened Files:** Processes all open files.
3. Set processing, saving, and file naming options and choose OK.

Batch Action Process Options

Override Action "Open" Commands: Make sure that the files you select in the Batch command are processed. .

Include All Subfolders: Processes files in subfolders of the specified folder.

Suppress Colour Profile Warnings: Turn off the display of colour settings

Suppress File Open Options Dialogs: Hides File Open Options dialog boxes.

Destination menu: Sets where to save the Batch Action files

None: files stay open without saving changes, unless action includes a Save

Save And Close: Saves the files in their current location, overwriting the original .

Folder: Saves the Batch files to another location specified

Override Action "Save As" Commands: Make sure that batch files are saved to the destination folder specified in the Batch command (or to their original folder if you chose Save and Close.

File Naming: Specifies file naming conventions if writing files to a new folder.

Compatibility: Makes filenames compatible with Windows, Mac OS, and UNIX operating systems.

Error menu: Specifies how to handle processing errors

Stop for Errors: Suspends the process until you confirm the error message.

Log Errors to File: Records each error in a file while continuing the Batch. To review the error file, open with a text editor after the Batch command has run.

DROPLET

A droplet applies an action to one or more images, or a folder of images, that you drag onto the Droplet icon (an .EXE file) You can save a droplet on the desktop or to another location on disk.

1. Choose File > Automate > Create Droplet
2. Specify where to save the droplet
3. Select the Action Set and action you want to use.
4. Set processing, saving, and file naming options and choose OK.

Tips for cross-platform droplets

- When creating droplets for both Windows and Mac OS, keep the following compatibility issues in mind:
- After moving a droplet created in Windows to Mac OS, you must drag the droplet onto the Photoshop icon on your desktop. Photoshop updates the droplet for use in Mac OS.
- When creating a droplet in Mac OS, use the .exe extension to make droplets compatible with both Windows and Mac OS.
- References to filenames are not supported between operating systems. If an action step references a file or folder name (such as an Open command, Save As command, or adjustment command that loads its settings from a file), execution pauses and the user is prompted for a filename.

Note: Drag a file or folder onto the droplet icon. Photoshop starts if it is not already running.

Note: Droplets have the same options available as Batch Processing.

IMAGE PROCESSOR

The Image Processor converts and processes multiple files. Unlike the Batch command, the Image Processor lets you process files without first creating an action.

The Image Processor works with Photoshop (PSD), JPEG, and camera raw files. You can do any of the following in the Image Processor:

- Convert a set of files to either JPEG, PSD, or TIFF format; or convert files simultaneously to all three formats.
- Process a set of camera raw files using the same options.
- Resize images to fit within specified pixel dimensions.
- Embed a colour profile or convert a set of files to sRGB and save them as JPEG images for the web.
- Include copyright metadata in the converted images.

Image Processor Process

Unlike Batch which is found in Automate. Image Processor can be found in Scripts.

1. Choose File > Scripts > Image Processor
2. Select the images you want to process. You can choose to process any open files, or select a folder of files to process
3. Select the location where you want to save the processed files.
4. Select the file types and options to save
5. Click Run

Image Processor Options

SaveAsJPEG:Saves images in JPEG format within a folder called JPEG in the destination selected.

Quality: Sets the JPEG image quality between 0 and 12. Similar to normal Jpeg save options.

ResizeToFit:Resizes the image to fit within the dimensions you enter in Width and Height. The image retains its original proportions.

ConvertProfileToRGB:Converts the colour profile to sRGB.

SaveAsPSD:Saves images in Photoshop format within a folder called PSD in the destination selected.

MaximizeCompatibility:Saves a composite version of a layered image within the target file for compatibility with applications that can't read layered images.

SaveAsTIFF:Saves images in TIFF format within a folder called TIFF in the destination selected.

LZWCompression:Saves the TIFF file using the LZW compression scheme.

RunAction:Runs a Photoshop action.

CopyrightInfo:Information you include here overwrites the copyright metadata in the original file.

IncludeICCProfile:Embeds the colour profile with the saved files

THANK YOU
