

Diploma in

PHOTOSHOP

SUMMARY NOTES

Photoshop Illustrations
Lessons 27 & 28

WHILE ADOBE ILLUSTRATOR IS THE PREFERRED TOOL BY MOST DESIGNERS FOR ILLUSTRATING AND DRAWING DIGITALLY, PHOTOSHOP CAN ALSO BE USED FOR SOME TYPES OF ILLUSTRATION. THIS LESSON EXPLORES THESE CAPABILITIES, AND YOU WILL LEARN HOW TO CREATE AN ILLUSTRATION FROM SCRATCH!

2.01 Photoshop Illustrations

2.02 Shape Tools

2.03 Filter Gallery

2.04 Sketch Effect

Photoshop Illustrations

PHOTOSHOP ILLUSTRATIONS

“Vectors are now a big part of Photoshop creations and can be used to make various styled illustrations.”

Photoshop isn't just for photographs. Take your design further by making custom shapes in Photoshop. Vector graphics like these can be scaled and edited as much as you like.

Although Photoshop is an image editor, over the years it has adapted to become more graphical. As advanced are made to Photoshop with each version update more tools and options become available. Photoshop has now adapted some of the tool found in the adobe graphical application, Illustrator. Vectors are now a big part of Photoshop creations and can be used to make various styled illustrations. Vectors are created using the Pen Tool, the Text Tool or the Shape Tool.

As an image editor Photoshop is highly capable of using certain techniques to create an illustration effect. This can be quickly done with the filters and filter gallery. Please review the lesson for specific tips and remember to experiment with the gallery options.

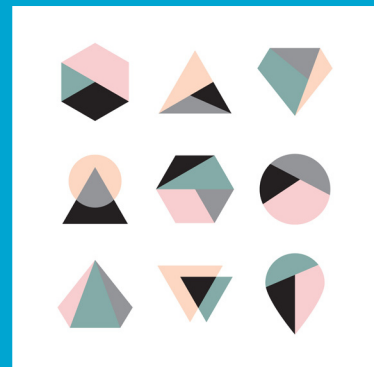

Using a combination of the pen tool and shape layers it is possible to create Vector art, Geometric Vector art and Vector portraits.

Tip: the Pen works on a point to point basis but you can create curves and angles with the pen tool. If creating Geometric Art, it is possible to crop have of the image with Delete cropped pixels turned off. This will allow you to create one side of the image and duplicate and flip the other side.

SHAPE TOOLS

We have a range of options when using The Shape Tool:

1. **Rectangle Shape Tool**
2. **Rounded Rectangle Shape Tool**
3. **Elliptical Shape Tool**
4. **Polygonal Shape Tool**
5. **Line Tool**
6. **Custom Shape Tool**

To Draw a shape:

1. **Select a shape tool**
2. **Make sure Shape is chosen from the menu in the options bar.**
3. **To choose the colour of the shape, click the colour swatch in the options bar, and then choose a colour from the Colour Picker.**
4. **Drag in your image to draw a shape**

Notes: To constrain a rectangle or rounded rectangle to a square, to constrain an ellipse to a circle, or to constrain the line angle to a multiple of 45 degrees, hold down Shift. To draw from the centre out, position the pointer where you want the centre of the shape to be, press Alt/Option, and then drag diagonally to any corner or edge until the shape is the desired size.

When using the shape tool you will have specific properties and options to use:

Options: draw as Shape, Path or Pixels

Fill: Solid Colour, Gradient Pattern, Colour Picker or No Fill (No Fill is shown as a red stroke through the box)

Stroke: Solid Colour, Gradient Pattern, Colour Picker or No Fill (No Fill is shown as a red stroke through the box)

Stroke Size: Slider to change the pixel size so the stroke

Stroke Type: Optional strokes to choose

Shape Parameters/Width & Height: pixel size of the image, can be adjusted manually

Alignment: Shape Align

Placement: Shape placement behind or in front

Custom Shape: only available on custom shape tool

FILTER GALLERY

Artistic Filters

- **Coloured Pencil** - Draws an image using coloured pencils on a solid background. Edges are retained and given a rough crosshatch appearance; the solid background colour shows through the smoother areas.
- **Cut-out** - Makes an image appear as though it were constructed from roughly cut pieces of coloured paper. High-contrast images appear as if in silhouette, and coloured images are built up from several layers of coloured paper.
- **Dry Brush** - Paints the edges of the image using a dry brush technique (between oil and water colour). The filter simplifies an image by reducing its range of colours to areas of common colour.
- **Film Grain** - Applies an even pattern to the shadow tones and midtones. A smoother, more saturated pattern is added to the lighter areas. This filter is useful for eliminating banding in blends and visually unifying elements from various sources.
- **Fresco** - Paints an image in a coarse style using short, rounded, and hastily applied daubs.
- **Neon Glow** - Adds various types of glows to the objects in an image. This filter is useful for Colourizing an image while softening its look. To select a glow colour, click the glow box, and select a colour from the Colour Picker.
- **Paint Daubs** - Lets you choose from various brush sizes (from 1 to 50) and types for a painterly effect. Brush types include Simple, Light Rough, Dark Rough, Wide Sharp, Wide Blurry, and Sparkle.
- **Palette Knife** - Reduces detail in an image to give the effect of a thinly painted canvas that reveals the texture underneath.
- **Plastic Wrap** - Coats the image in shiny plastic, accentuating the surface detail.

- **Poster Edges** - Reduces the number of colours in an image (posterizes it) according to the posterization option you set, and finds the edges of the image and draws black lines on them. Large broad areas have simple shading, and fine dark detail is distributed throughout the image.
- **Rough Pastels** - Applies strokes of pastel chalk on a textured background. In areas of bright colour, the chalk appears thick with little texture; in darker areas, the chalk appears scraped off to reveal the texture.
- **Smudge Stick** - Softens an image using short diagonal strokes to smudge or smear the darker areas. Lighter areas become brighter and lose detail.
- **Sponge** - Creates images with highly textured areas of contrasting colour, simulating the effect of sponge painting.
- **Underpainting** - Paints the image on a textured background, and then paints the final image over it.
- **Water Colour** - Paints the image in a water colour style using a medium brush loaded with water and colour, simplifying details. Where significant tonal changes occur at the edges, the filter saturates the colour.

Brush Stroke Filters

- **Accented Edges** - Accentuates the edges of an image. When the edge brightness control is set to a high value, the accents resemble white chalk; when set to a low value, the accents resemble black ink.
- **Angled Strokes** - Repaints an image using diagonal strokes, with lighter and darker areas painted in strokes going in opposite directions.
- **Crosshatch** - Preserves the details and features of the original image while adding texture and roughening the edges of the coloured areas with simulated pencil hatching.

- **Dark Strokes** - Paints dark areas with short, tight, dark strokes, and lighter areas with long, white strokes.
- **Ink Outlines** - Redraws an image with fine narrow lines over the original details, in pen-and-ink style.
- **Spatter** - Replicates the effect of a spatter airbrush. Increasing the options simplifies the overall effect.
- **Sprayed Strokes** - Repaints an image, using its dominant colours, with angled, sprayed strokes of colour.
- **Sumi-e** - Paints an image in Japanese style, as if with a fully saturated brush applied to rice paper. Sumi-e creates soft, blurred edges with rich, inky blacks.

SketchFilters

- **Bas Relief** - Transforms an image so that it appears carved in low relief and lit to accent the surface variations. Dark areas of the image take on the foreground colour, and light colours use the background colour.
- **Chalk & Charcoal** - Redraws highlights and midtones with a solid midtone gray background drawn in coarse chalk. Shadow areas are replaced with black diagonal charcoal lines. The charcoal is drawn in the foreground colour; the chalk, in the background colour.
- **Charcoal** - Creates a posterized, smudged effect. Major edges are boldly drawn, and midtones are sketched using a diagonal stroke. Charcoal is the foreground colour, and the background is the colour of the paper.
- **Chrome** - Renders the image as if it had a polished chrome surface. Highlights are high points, shadows are low points in the reflecting surface. After applying the filter, use the Levels dialog box to add more contrast to the image.

- **Conté Crayon** - Replicates the texture of dense dark and pure white Conté crayons on an image. The Conté Crayon filter uses the foreground colour for dark areas and the background colour for light areas. For a truer effect, change the foreground colour to one of the common Conté Crayon colours (black, sepia, or sanguine) before applying the filter. For a muted effect, change the background colour to white, add some of the foreground colour to the white background, and then apply the filter.
- **Graphic Pen** - Uses fine, linear ink strokes to capture the details in the original image. The effect is especially striking with scanned images. The filter replaces colour in the original image, using the foreground colour for ink and the background colour for paper.
- **Halftone Pattern** - Simulates the effect of a halftone screen while maintaining the continuous range of tones.
- **Note Paper** - Creates an image that appears to be constructed of handmade paper. This filter simplifies images and combines the effects of the Stylize > Emboss and Texture > Grain filters. Dark areas of the image appear as holes in the top layer of paper, revealing the background colour.
- **Photocopy** - Simulates the effect of photocopying an image. Large dark areas tend to be copied only around their edges, and midtones fall away to either solid black or solid white.
- **Plaster** - Molds an image from 3D plaster, and then Colourizes the result using the foreground and background colour. Dark areas are raised, and light areas are recessed.
- **Reticulation** - Simulates the controlled shrinking and distortion of film emulsion to create an image that appears clumped in the shadows and lightly grained in the highlights.

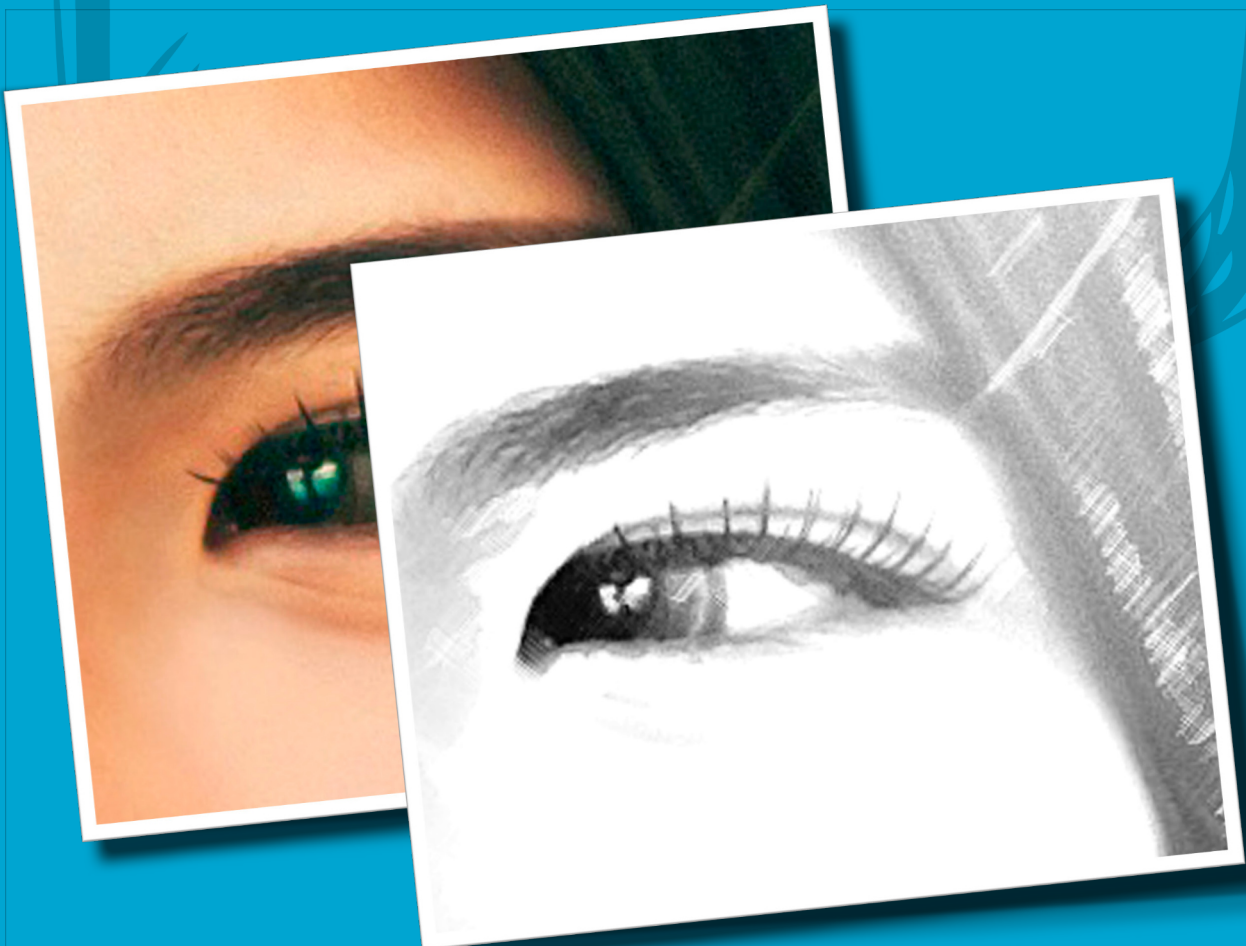

- Stamp - Simplifies the image so that it appears to be created with a rubber or wood stamp. This filter is best used with black-and-white images.
- Torn Edges - Reconstructs the image so that it appears composed of ragged, torn pieces of paper, and then Colourizes the image using the foreground and background colours. This filter is particularly useful for text or high-contrast objects.
- Water Paper - Uses blotchy daubs that appear painted onto fibrous, damp paper, causing the colours to flow and blend.

Texture Filters

- Craquelure - Paints an image onto a high-relief plaster surface, producing a fine network of cracks that follow the contours of the image.
- Grain - Adds texture to an image by simulating different kinds of grain Regular, Soft, Sprinkles, Clumped, Contrasty, Enlarged, Stippled, Horizontal, Vertical, and Speckle, available from the Grain Type menu.
- Mosaic Tiles - Renders the image so that it appears to be made up of small chips or tiles and adds grout between the tiles. (In contrast, the Pixelate > Mosaic filter breaks up an image into blocks of different coloured pixels.)
- Patchwork - Breaks up an image into squares filled with the predominant colour in that area of the image. The filter randomly reduces or increases the tile depth to replicate the highlights and shadows.
- Stained Glass - Repaints an image as single-coloured adjacent cells outlined in the foreground colour.
- Texturizer - Applies a texture you select or create to an image.

SKETCH EFFECT

1. Duplicate Image: Ctrl J
2. Desaturate: Ctrl/Cmd I
3. Duplicate Desaturated Image: Ctrl J
4. Invert Colours: Ctrl/Cmd Shift U
5. Blend Mode: Linear Dodge
6. Filter Blur: Gaussian Blur

THANK YOU
