- Types of social insights
- Social media metrics maths
- Attribution models

Fun Fact

DID YOU KNOW: Data-driven businesses grow 30% more per year than their competitors and are also six times more likely to be profitable.

Data-driven marketing

What is data-driven marketing?

An approach to optimising your brand based on customer data which helps to predict their needs, desires and future behaviors.

Benefits of data-driven social media

- Personalise the customer experience across your entire customer journey
- Target well-defined audience segments
- Attract new customers through high-quality leads who are more likely to convert, and if they have a good experience they are more likely to recommend you and therefore attract more potential customers
- Measure and improve strategies in real time. Remember that your strategy should be a living document that adjusts and changes according to the data.

Types of social analytics

Tells you what you are looking for in your data.

Descriptive analytics

- Hindsight
- Reactive in nature
- Focuses on what happened
- Most common form of social analytics
- Broad overview of campaign performance
- Helps you to identify core business problems or opportunities
- This would be monthly reports

Diagnostic analytics

- Insight
- Reactive in nature
- Identify the core contributors to successful or failed campaigns
- Allows you to filter through broad data for specific information
- Use this information to improve future campaigns

Predictive analytics

- Foresight
- Proactive by nature
- Predict a future event that can benefit or improve a social media campaign
- Analyse your social media for user intent
- The aim is to increase the chances of a favourable response
- What is the influencing factor for their purchase decision

Prescriptive analytics

- Foresight
- Proactive by nature
- Provides clarity on how to approach a campaign for the best possible results
- Replicate successful campaigns

Types of social insights

Descriptive insights

Statement of fact or probability based on data which tells you;

- Where to focus your time
- What types of messages to craft
- What content to reate
- Which existing content you can leverage
- Which customers to target

Exploratory insights

Finding relationships within data, is something due to;

- Causation: the capacity of one variable to influence another OR
- Correlation: a statistical measure that indicates the extent to which two or more variables fluctuate
- These insights are a good starting point for exploring further connections

Inferential insights

Use small data sets to understand a large group

- Take a sample size from customers and make larger inferences from that data
- Draw longer and more detailed conclusions in order to direct funding and get budget allocation
- Target the right audience with the right ads
- Identify problem areas to address
- Understand the customer from a high-level overview

Social media metrics maths

Awareness metrics

Audience growth rate

Measures: The speed at which your brand's following is increasing
Equation: Net new followers / Total audience X 100 = Growth rate percentage
How to use:

- Evaluate the performance and growth on each network
- Track growth rate for new campaigns or initiatives
- Expand on the right demographics
- Competition comparison for realistic audience growth

Post reach

Measures: How many people have seen a post since it went live
Equation: Post reach / Total followers X 100 = Post reach percentage

How to use:

- Allows you to take action as it tells you when your audience is online and what your audience finds valuable

Potential reach

Measures: The number of people who could realistically see a post during a reporting period
Equation: Total number of mentions X Followers of an account that mentioned you = Theoretical reach

How to use:

- Potential reach allows you to gauge your progress
- This is important because you should always work towards expanding your audience

Social share of voice (SSoV)

Measures: The number of people who are mentioning your brand on social media compared with your competitors
Equation: Brand mentions + Competitor mentions / Total mentions X 100 = SSoV percentage

How to use:

- Identify your brand relevance compared to your competitor
- Include direct and indirect mentions

Engagement metrics

Applause rate

Measures: The number of approval actions (likes, favourites) a post receives relative to your total number of followers
Equation: Total approval actions / Total followers X 100 = Applause rate percentage

How to use:

- Allows you to identify valuable content
- Informs content going forward

Average engagement rate

Measures: The number of engagement actions (likes, shares, comments) on a post relative to your total number of followers
Equation: Total engagements / Total followers X 100 = Average engagement rate percentage

How to use:

- Allows you to prove that your content is resonating with your audience

Amplification rate

Measures: The ratio of shares per post to the number of overall followers
Equation: Total post shares / Total followers X 100 = Amplification rate percentage
How to use:

- A higher amplification rate means that followers are more willing to share your content and associate themselves with your brand

Virality rate

Measures: The number of people who shared your post relative to the number of unique views it had during a reporting period
Equation: Number of shares / Number of impressions X 100 = Virality rate percentage

How to use:

- Goes beyond just measuring likes
- It can pinpoint posts that are far more likely to succeed

Conversion metrics

Conversion rate

Measures: The number of visitors who - after clicking on a post - take action on a page against your total website visitors
Equation: Conversions / Total clicks X 100 = Conversion rate percentage

How to use:

- A high conversion rate proves that your content is valuable and compelling
- It also shows that your content kept its promise

Click-through-rate (CTR)

Measures: How often people click on the call to action linked to your post
Equation: Total clicks / Total impressions X 100 = CTR percentage

How to use:

- Tied to a link that brings the audience to additional content
- Provides insight into how compelling your offer is - particularly if you look at this in conjunction with the conversion rate

Cost-per-click (CPC)

Measures: The amount you pay per click on your sponsored social media posts
Equation: Total ad spend / Total measured clicks X 100 = CPC percentage

How to use:

- Helps to identify if ad spend investment is efficient or wasteful

Cost-per-thousand impressions (CPM)

Measures: The amount you pay every time a thousand people scroll past your sponsored social media content
Equation: Total ad spend / Total ad impressions X 100 = CPM percentage

How to use:

- More useful when split testing content as it drives impressions and views not necessarily Action

Return on investment (ROI)

Measures: The value of your social media efforts
Equation: Revenue / Investment X 100 = Social media ROI percentage
How to use:

- Identifies whether all social media marketing spend is profitable or wasteful

Why are these metrics useful?

- You can demonstrate the value of your work with these metrics
- Substantiate a bigger social media marketing budget
- Showcase analytics in story format
- Make smarter, data-driven decisions

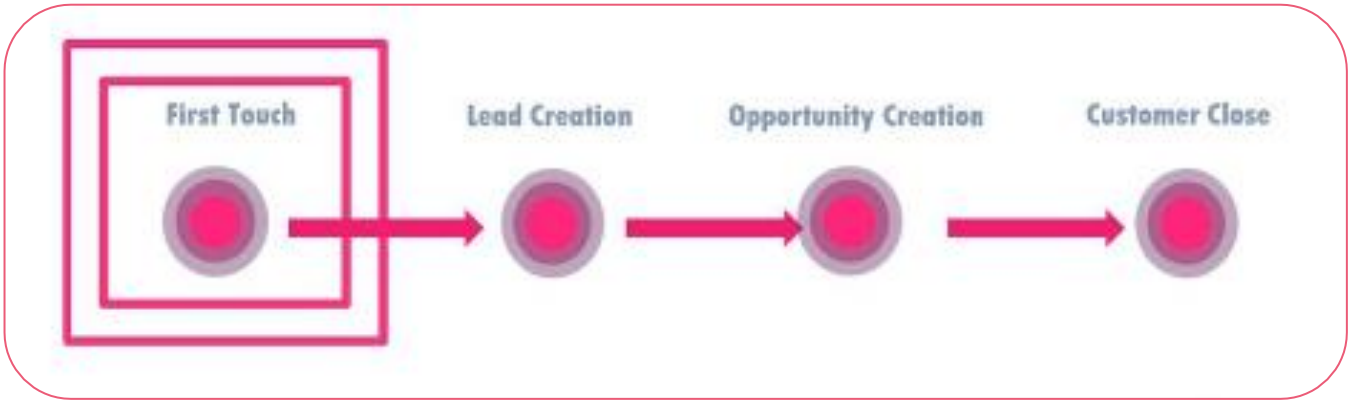
Attribution Models

What are attribution models?

Attribution modelling is a set of rules that determines how conversions are assigned to the various touch points in the customer conversion path.

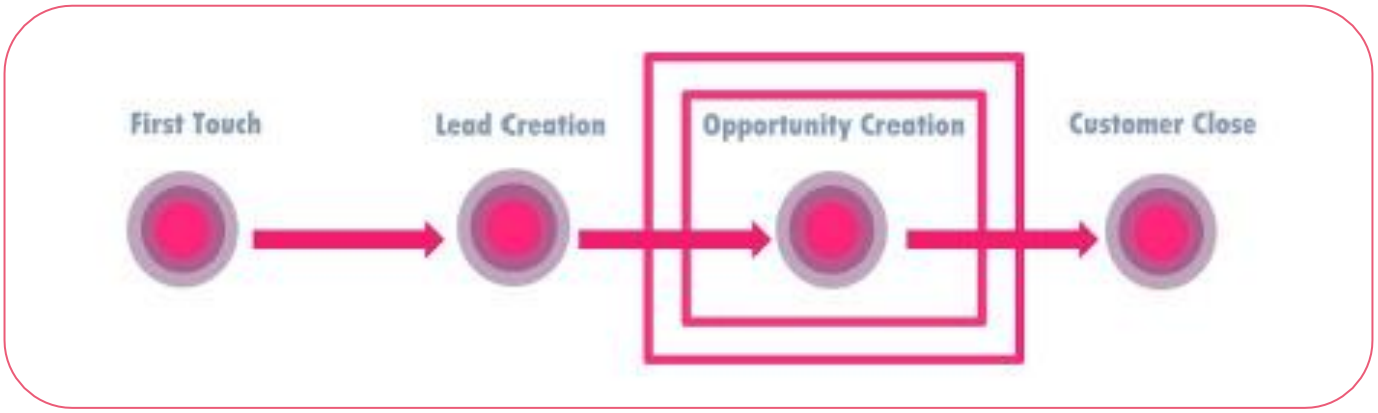
First Touch Attribution Model

- Identifies the channel that first directed a lead to your brand
- It's important to remember that conversions at the end of the funnel would not have been possible without this step
- It is most effective for top-of-funnel campaigns
- Helps to optimise the lead generation process



Pros	Cons
Easy set-up	Prone to error
Minimal analysis	Emphasis on start of journey
Identifies performing content and ads	Difficult to optimise full funnel

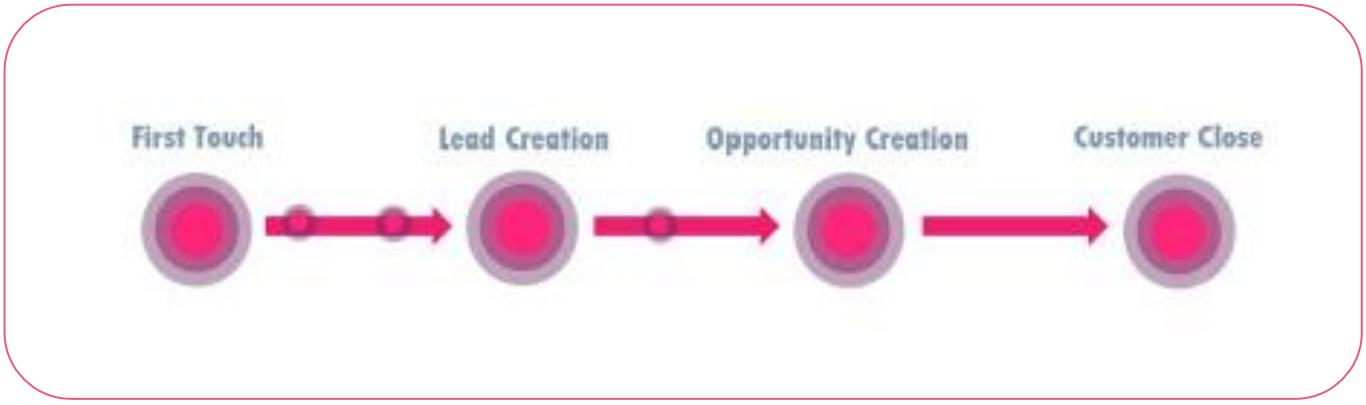
Last Touch Attribution Model



Pros	Cons
Shows what directs and drives customers to convert	Reflects only end of funnel
Simple and no learning curve required	Difficult to analyse the whole funnel

Linear attribution model

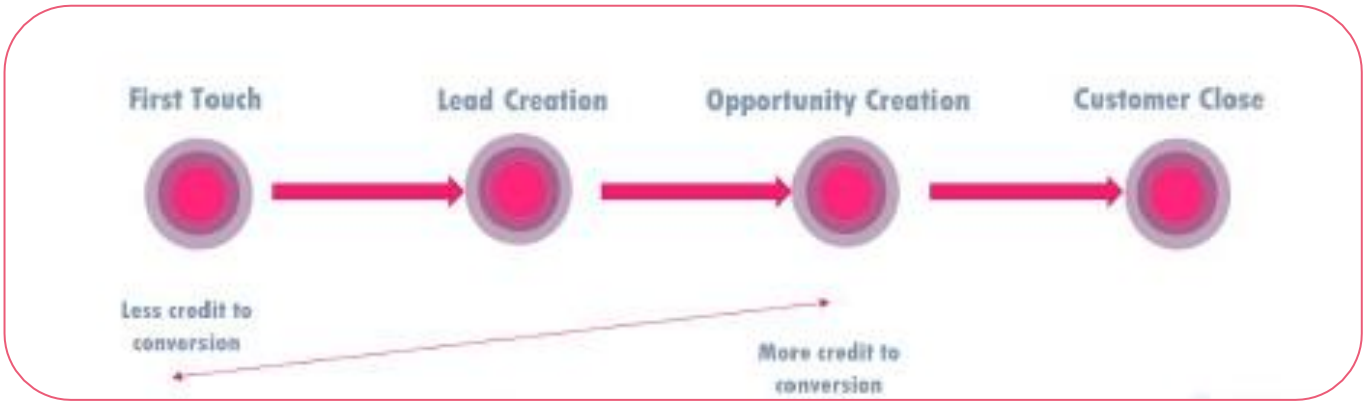
- Distributes content equally
- Most suitable to small teams with long sales cycles
- Helps to fill in the gaps between the first and last touch



Pros	Cons
More complete overview	Can't fully optimise
No importance on any particular touch point	Not all touch points are equal
Easy to set-up	

Time decay attribution model

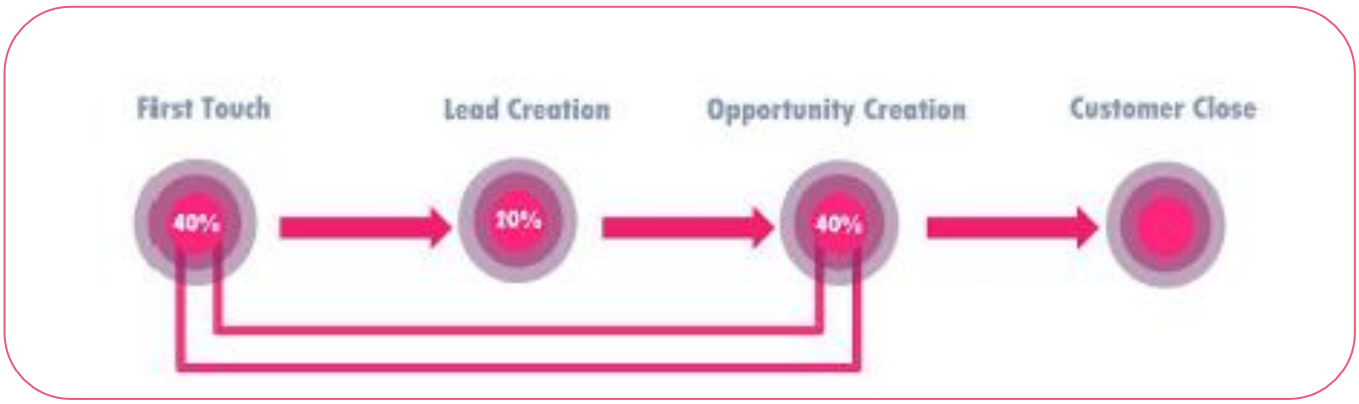
- Gives more significance to certain touch points close to the conversion
- More focused on middle to bottom of the funnel
- Ideal for long sales cycles
- Focuses on what drove conversion so that you can optimise it



Pros	Cons
Optimise the touch points close to the conversion	Depending on circumstance the various touch points may have played different roles

Time decay attribution model

- Gives credit to 3 main touchpoints
- 40% to first and last touch point
- 20% to middle touch point
- Best suited to companies with short sales cycles



Pros	Cons
First touch point is as important as the last touch point	The middle point may have been what drove them to convert

Algorithmic attribution model

- Most accurate way to measure a users journey
- Success rate is higher as this is specifically created for a company individually
- Allows an in-depth study of the whole funnel
- Suited to long, complicated sales processes that use marketing qualified and sales qualified leads

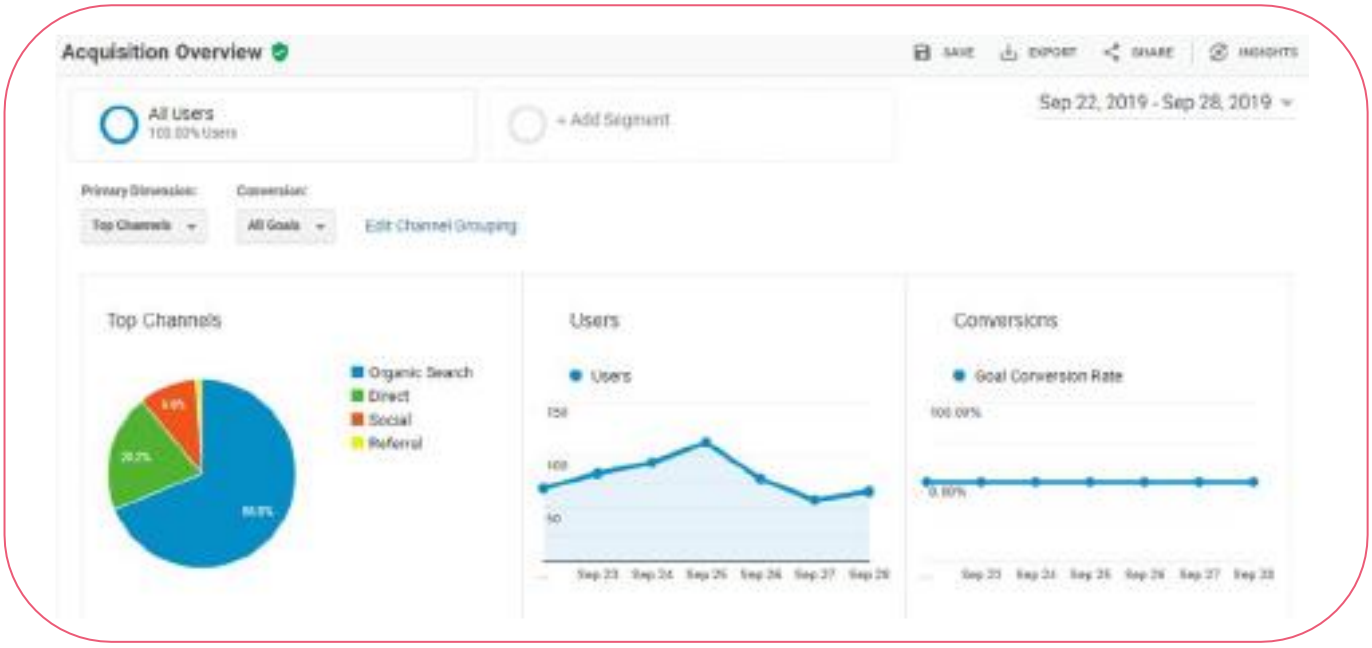
Pros	Cons
Credit the touch points that matter most	Complex set-up
Most accurate data	May require a data analyst or advanced tools
Optimise entire funnel	Price point is high

Choosing the right attribution model

- Align with your social media goals
- Identify what is most important to your company
- Use multiple attribution models in conjunction with each other
- Or use one until you have achieved a specific goal and then more onto another one

Track your social media attributions

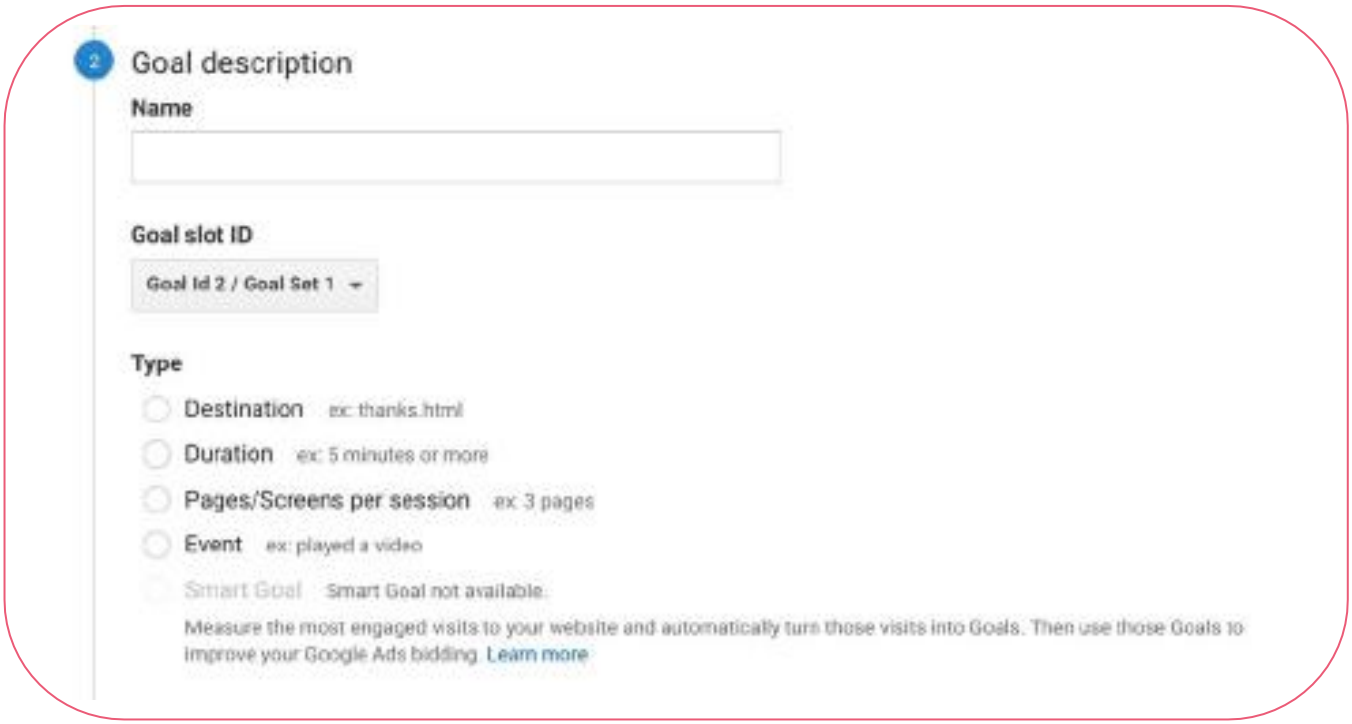
Acquisition > Overview



Acquisition > Social > Conversions

Set up goals

Admin > Goals > Add goal



Social media attribution tools

- Oktopost
- Segment
- Clickmeter

Calculate ROI

Calculate the return on investment from your various touch points and then optimise the content that is working or stop any content that is not working.
